

Be Sterne: Variabilität auf verschiedenen Zeitskalen

Klaus Bernhard
Hartha, Mai 2017

Erik Wischnewski

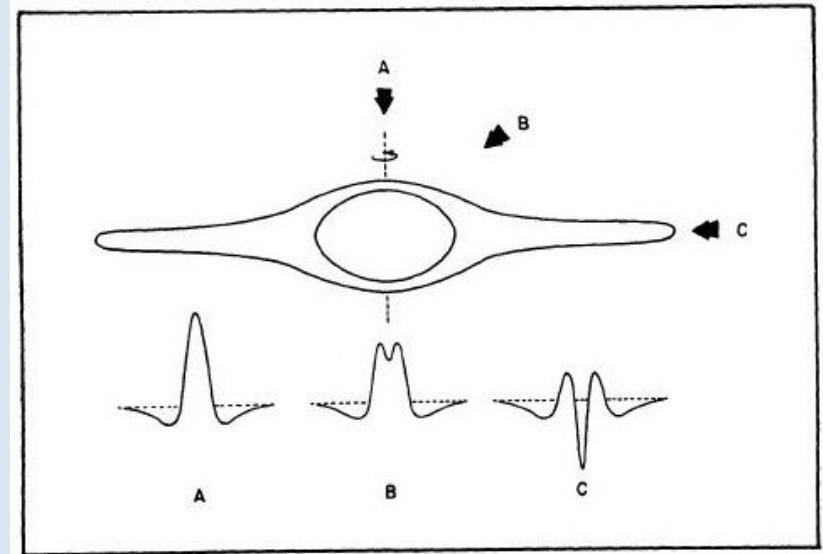

Was sind Be Sterne?

- Während ‚normale‘ B Sterne nur Absorptionslinien zeigen, zeigen Be Sterne zumindest zeitweise Balmer-Emissionslinien.
- Jaschek et al. (1981): „**A non-supergiant B star whose spectrum has, or had at some time, one or more Balmer lines in emission.**“ (klassische, weit verbreitete Definition)
- Das Be Phänomen ist schon seit langem bekannt. So berichtete Pater A. Secchi bereits 1866 bei einer Beobachtung von γ Cas über das Vorhandensein einer hellen (Emissions)Linie an der Stelle von H β :
„[...] une particularité curieuse ... une ligne lumineuse très-belle et bien plus brillante que toute le reste du spectre.“
(verfasst in Französisch von einem italienischen Astronomen, der im Vatikan arbeitete, und erschienen in einem deutschen Journal [AN]; vgl. Rivinius et al. 2013)

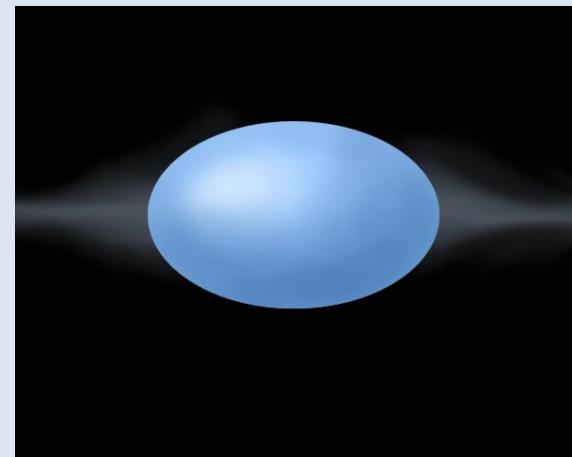

Was sind Be Sterne (Fortsetzung)?

- OeBeAe-Sterne: frühe Sterne der Leuchtkraftklasse V, IV, oder III (also keine Überriesen)
- zeigen mindestens zeitweise Balmer-Emissionslinien
- Emissionslinien entstehen in optisch dünnen Hüllen entlang des Äquators = Dekretionsscheibe

Einige Eigenschaften

- Be Sterne rotieren sehr schnell (~75% der kritischen Rotationsgeschwindigkeit oder mehr)
- Neuere Beobachtungen mit Weltraumteleskopen legen nahe, dass alle Be Sterne non-radiale Pulsationen aufweisen (z.B. Baade et al. 2016).
- Mechanismen, die zur Ausbildung der Scheibe führen, sind nicht abschließend geklärt, jedoch wird vermutet, dass Pulsationen eine entscheidende Rolle spielen.
- Scheibenbildung auch durch den Einfluss eines Begleitsterns möglich.
- Beispiel Achernar (Alpha Eri) einer der 10 hellsten Sterne; bei uns unbeobachtbar

Be Sterne und der GCVS

BE

GCVS-type for Be stars that show variability but no light outbursts (GCAS variables). Most of them may be **LERI** variables.

GCAS

Eruptive irregular variables of the γ Cassiopeiae type. These are rapidly rotating O9-A0 III-Ve stars with mass outflow from their equatorial zones. The formation of equatorial rings or disks is accompanied by a temporary brightening (pole-on stars like ω CMa) or fading (equator-on stars like Pleione). Light amplitudes may reach 1.5 mag. in V.

LERI

λ Eri type variables. Be stars with the light variation caused by rotational modulation or non-radial pulsations. Their light curves are usually double-waved and with changing amplitude. Periods in the order of 0.3 - 3 d.

B[e] Sterne vs. Be Sterne

- **FSCMa**

B[e]-type stars that exhibit much stronger Hydrogen emission lines than those seen in classical Be stars and also exhibit forbidden (low excitation) lines of Fell, [Fell], [NII], [OI] and strong IR excesses, which are indicative of compact dust envelopes. They are also not fast rotators like the Be stars. They are most likely binary systems that currently undergo or have recently undergone a phase of a rapid mass exchange, associated with dust formation. The secondaries are typically 2-3 magnitudes fainter than their primaries. Complex structure of the circumstellar environments significantly veils the underlying stars and requires multitechnique investigation. They are located outside star formation regions and they probably main sequence stars (not supergiants). Their light curves show irregular long-term variations with long term (years) mean magnitude changes up to 2 magnitudes in V. Most of the stars in this group were previously considered as Unclassified B[e] stars. Examples: FS CMa, V0743 Mon.

Delta Scorpii (δ Sco) - B-Stern im Helligkeitsausbruch

Wolfgang Vollmann

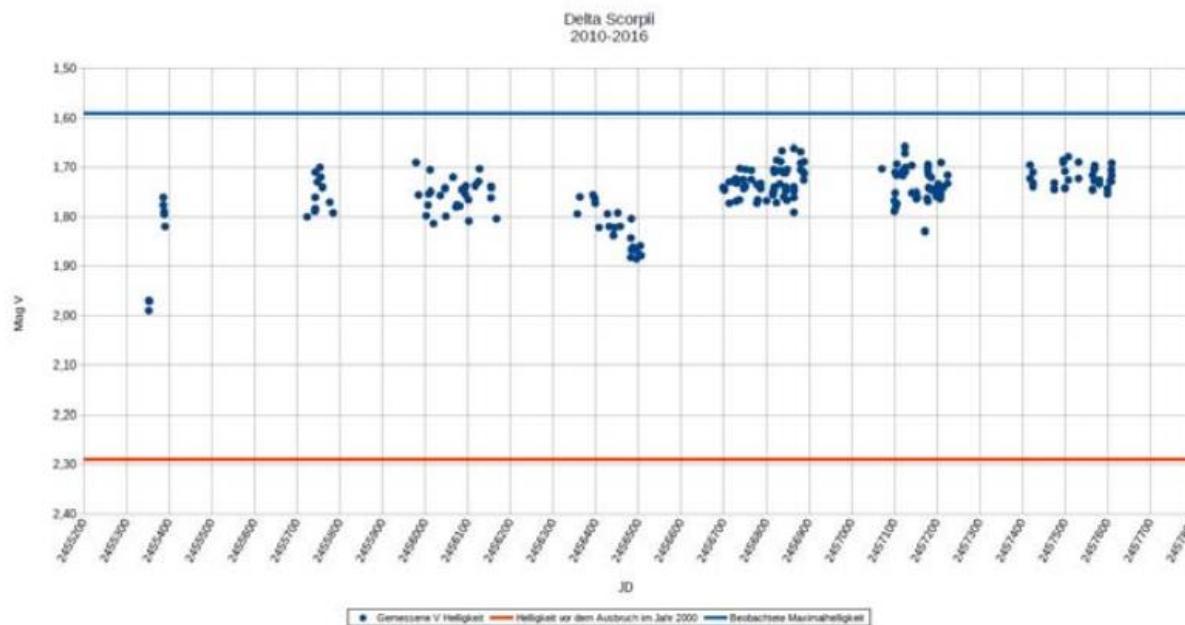

Abb. 2: Lichtkurve von Delta Scorpii in den Jahren 2010 bis 2016, beobachtet mit der Digitalkamera. Jeder Messpunkt ist der Mittelwert aus 10 Einzelfotos. Die blaue Linie zeigt die bisher erreichte Maximalhelligkeit des Sterns in den Jahren 2003/2004. Die rote Linie zeigt die Sternhelligkeit vor dem Helligkeitsanstieg im Jahr 2000. Die beobachteten Helligkeitsänderungen in den sieben Jahren sind gering, zwischen 1,7 und 2,0 mag.

Zeitskalen der Veränderlichkeit

Astron. Astrophys. Suppl. Ser. **108**, 237-250 (1994)
